

## **Energy Advice**

A range of different methods can be employed to ensure your home is as efficient as it can be and that you are using as little energy to give maximum output, saving you money on your energy bills.

The following are Stelrad's top tips you could follow in order to save yourself some money on your energy bills:

### *Tip 1*

If your boiler is 10 years old, or older, you may need to replace it with a newer model to ensure it is working as efficiently as possible.

### *Tip 2*

Similarly to your boiler, if your Stelrad Radiators require updating, renewing these would also mean your home would be more energy efficient.

### *Tip 3*

Turn down your thermostat – even by 1 centigrade would save you money.

### *Tip 4*

Use the timer controls on your boiler to ensure that the heating system is only on when someone is in the house/when it is needed so that no energy is wasted heating the house when it is not necessary.

### *Tip 5*

Use Stelrad centre tap TRV's on your Stelrad Radiators so you can control the heat coming from each radiator – this will allow you to personalize how much heat is needed from each specific Stelrad Radiator, again meaning no energy is wasted and that your home is as efficient as possible.

### *Tip 6*

Ensure your home is well insulated and draught proof so that no heat can escape through doors/windows/walls.
